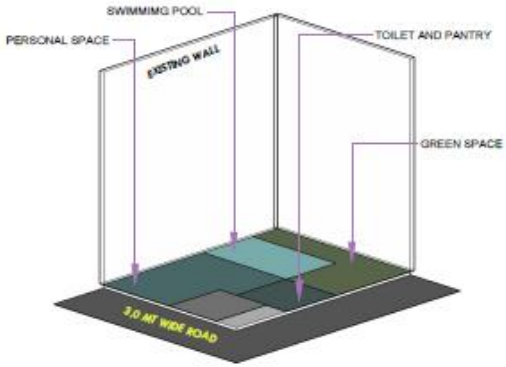
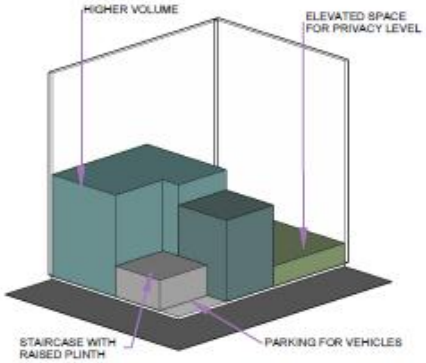
01 COMPACT RESIDENTIAL DESIGN

This is a residence designed with equal focus on spatial calm and aesthetically pleasing and peaceful surrounding.
It’s a home designed not just to shelter, but to respond, reveal, and belong.

01 COMPACT RESIDENTIAL DESIGN — HUMAN-CENTRIC SPATIAL PLANNING

AREA : 100 SQ. M



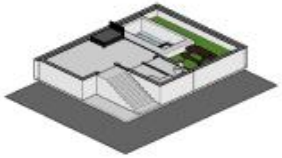


DESIGN AND CONCEPT:
THE ZONING STARTS WITH ENTRY THROUGH THE PERSONAL SPACE, FLOWING TOWARDS THE PANTRY,TOILET AND GREEN SPACE, MAINTAINING A STRONG CONNCETION WITH THE SWIMMING POOL.

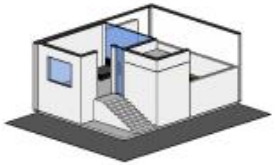
This project was conceived within a defined 10m × 10m site, adhering to a disciplined 40% built and 60% open ratio. The objective was to explore how spatial richness can emerge from restraint and proportion.

The built mass is carefully positioned to frame landscaped courts and a water body, allowing open space to function as an integral design element rather than residual area. Sectional views explain structural elements and service integration, including concealed plumbing and an overhead water tank.

SECTIONAL VIEWS



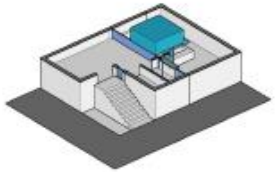
UNIFORM ELEVATION PROVIDED FOR PRIVACY



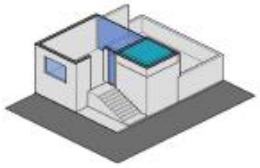
BRICKWORK FOR THE WALLS OF THE PERSONAL SPACE ARE MADE ABOVE THE PLINTH.

AFTER THE WALLS A LAYER OF BEAM IS MADE TO SUPPORT THE ABOVE CONSTRUCTED SLAB. A WALL OF PARAPET IS MADE ON EDGE OF SLAB.

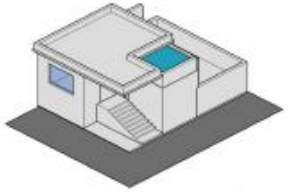
SECTIONAL INCLUDING SERVICES



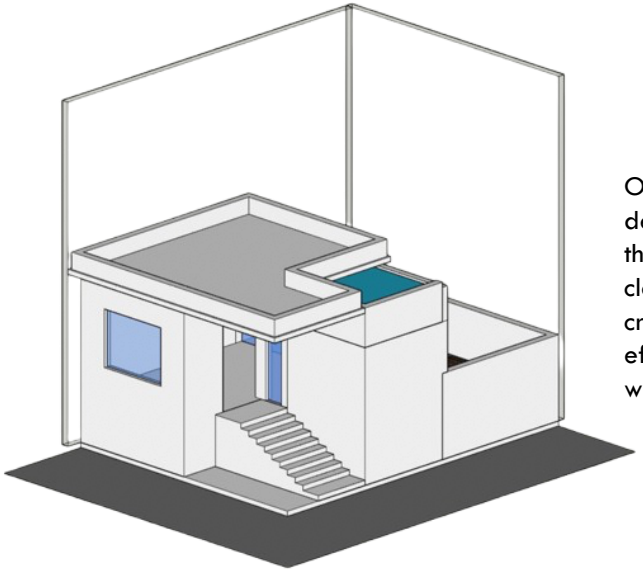
WATER PIPELINES GOES TO THE PANTRY AND BATHROOM FROM THE WATER TANK PLACED ABOVE.



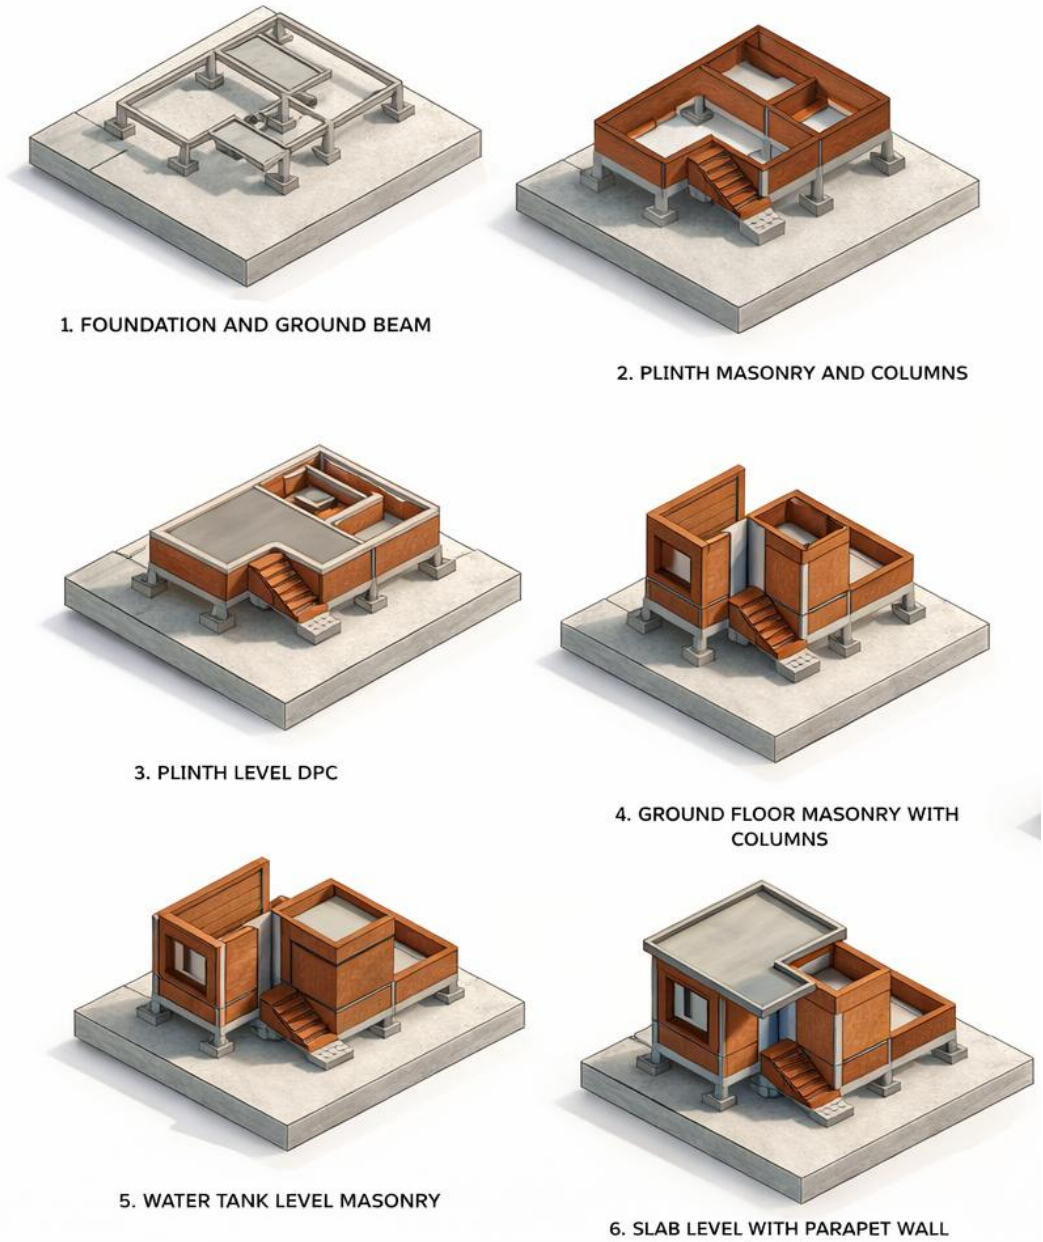
WATER PIPELINES ARE CONCEALED BY THE CONSTRUCTION OF CONCRETE AROUND IT.



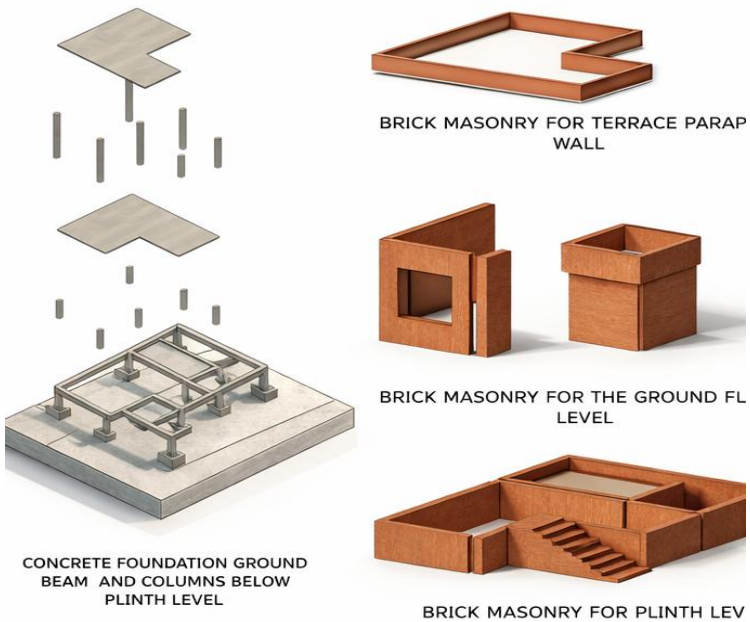
COMPLETE ISOMETRIC VIEW



Overall, the project demonstrates how thoughtful planning and clear spatial organization create a balanced and efficient living environment within a small footprint.



Generated with AI



This illustrates the complete construction sequence of a compact residential structure through clear isometric stages. It begins with isolated footings, ground beams, and columns forming the structural base below plinth level. The next stages introduce plinth masonry with DPC for moisture protection, followed by ground floor brick masonry integrated with structural columns that define internal spaces and stair access. The process then progresses to the water tank level and concludes with slab casting and parapet wall construction. Overall, the sheet highlights the systematic evolution from foundation to roof while showing the coordination between structural framework and brick masonry.
